$______
1. request packets: R: requested file name: other packet, other packets could either be data packets or nil
       packets. if R::other packet, this means no file is being requested. If no data, the other packet should be a nil
       packet(N:).
    2. data packets: B:file size:payload(begin) or M:payload(middle).
       3. nil packets: N:, used when there is no data to transfer, only instruction is transferred.
    4. end packets: E:, this packet is sent to end a connection when the transfer is finished.
    5. pending packets: P: the packet is sent when the file is not ready, almost equivalent to nil packet.
